

Before you start...

Before you embark on this manual AWS CloudFormation adventure, let us remind you that we've poured countless hours (and several pots of coffee) into creating a beautiful, automated deployment wizard that handles all the CloudFormation templates, Identity Center custom SAML application setup, and custom application configurations for you. It's tested, reliable, and significantly less likely to result in you going back and forth between the AWS console, CloudFormation stacks, and custom application logs at 2 AM trying to figure out why your deployment failed. If you're here because you enjoy the thrill of manually configuring SAML attributes, debugging CloudFormation syntax errors, and the unique satisfaction of troubleshooting custom application integrations that could have been automated entirely, then welcome—you're in the right place!

But seriously, unless you have a very specific reason for going manual, please consider using our automated script. Your future self will thank you, and so will our support team.

[Click here to see how to run the Installation Wizard instead](#)

Welcome to the Sandbox Studio Installation Script!
This script will guide you through the installation process.

[INFO] 2025-08-26 22:03:38 Fetching latest version information...

[INFO] 2025-08-26 22:03:38 Using latest version: 1.0.4

[INFO] 2025-08-26 22:03:38 Installation will proceed through the following steps:

1. Verify AWS account and region
2. Collect account information
3. Check prerequisites (incl. custom SAML application)
4. Collect configuration parameters
5. Deploy SandboxStudio-AccountPool stack
6. Deploy SandboxStudio-IDC stack
7. Deploy SandboxStudio-Network stack
8. Deploy SandboxStudio-Data, SandboxStudio-SES, SandboxStudio-Compute, SandboxStudio-API stacks
9. Custom domain
10. Sender e-mail
11. Configure AppConfig
12. Secrets Manager
13. Admin user in SBS

? Are you ready to proceed with the Sandbox Studio installation? [Y/n]:

Revision #10
